

Adversarial review — the reconcile digest fold under failure injection

Semantic pattern: **policy evaluation under injected corruption** → visual type: **flowchart** (attack lanes) · verified at HEAD 156b7ee · 1331 tests

Provenance manifest

diagram source	commit 156b7ee; probe evidence in hermes_redteam_reconciliation.md (second-audit section)
files inspected	src/hermes/research/controller.py (reconcile_digest, pending_classification_proposals, _classification_gate), src/hermes/persistence/failure_classifications.py (classifications_digest), src/hermes/persistence/migrations.py (idx_events_one_verdict, v11→12)

tests pinning each lane	lane 1: classifications_digest FORGED_IDENTITY/DEGRADED assertions in test_digest_fold_fail_closed_deterministic · lanes 2-3: tamper-signal + recomputed-gate assertions (same test) · lane 4: duplicate-decision IntegrityError assertion (same test) · lane 5: duplicate-proposal + deterministic-hash assertions (same test)
probe evidence	FORGED_IDENTITY error + DEGRADED status; tamper note fired for stored-PENDING/non-authority; stored-EFFECTIVE replayed as pending; second decision refused by the schema index; duplicate proposal could not resurrect a decided proposal; content_hash identical across repeated runs
projection rule	diagrams are never authority; executable code and ratified IDRs win on any conflict (hermes_diagram_design_skill.md)
